

Complexity and Funding Stability

Two Dimensions of Funding

- Core and non-core funding
- Short-term and long-term funding
- Both distinctions bear on the procyclicality of the financial sector, but the former is more important
 - Complexity of the financial system is about former
 - Risk-taking behavior is mostly about former

Punchline

“If you take care of the aggregates, the complexity will take care of itself”

Three Modes of Leveraging Up

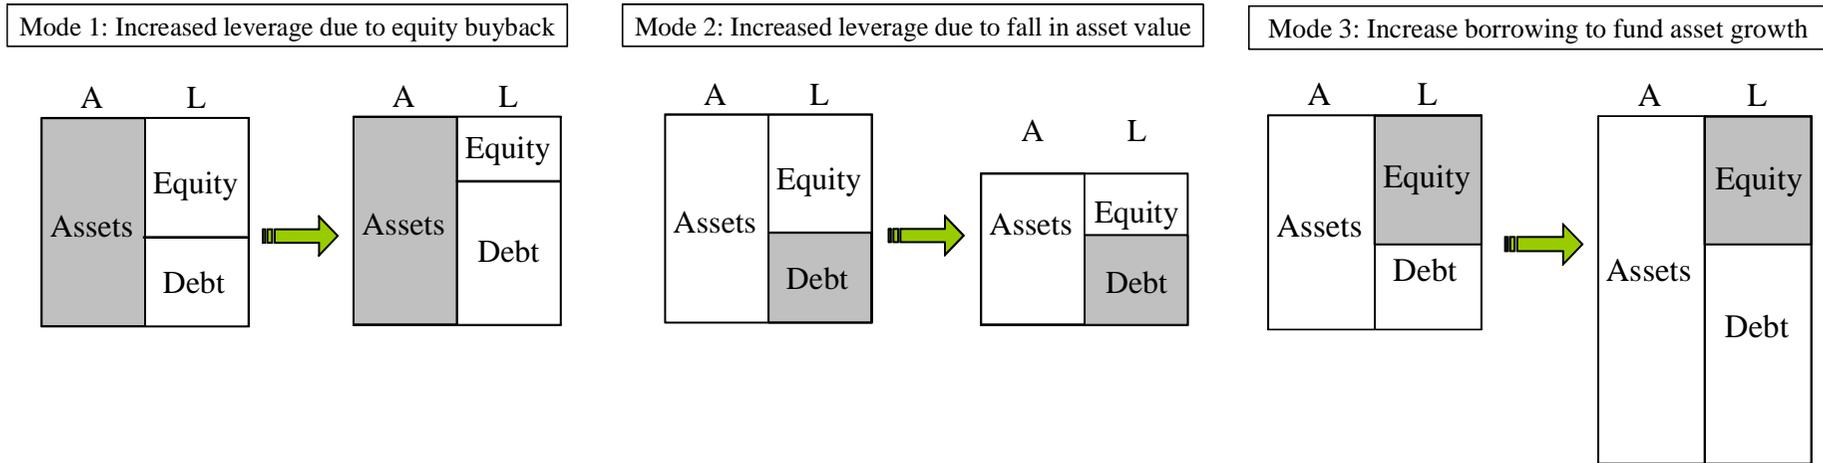

Figure 1. **Three modes of leveraging up:** Mode 1 is through an equity buyback through a debt issue. Mode 2 is through a dividend financed by asset sale. Mode 3 is through increased borrowing to fund new assets. In each case the grey area indicates balance sheet component that is held fixed

An Analogy

- Bank capital \mapsto Foundations of building
- Bank lending \mapsto Building itself
- Leverage \mapsto Relationship between height of building relative to its foundations

Leverage regulation \mapsto Building code stipulating how tall the building can be relative to foundation

Core and Non-Core Bank Liabilities

- **Core:** Liabilities to domestic household and non-financial claim holders
- **Non-Core:** Liabilities to financial intermediaries and foreign creditors

Ratio of non-core to core liabilities is:

- Procyclical
- Mirrors lowering of credit standards

Comparing Spain and Korea

- Both Korea and Spain highlight role of non-core liabilities
- Korea's non-core is
 - Short maturity
 - Denominated in foreign currency
- Spain's non-core is
 - Medium to long maturity
 - Denominated in domestic currency

Complexity and Non-Core Liabilities

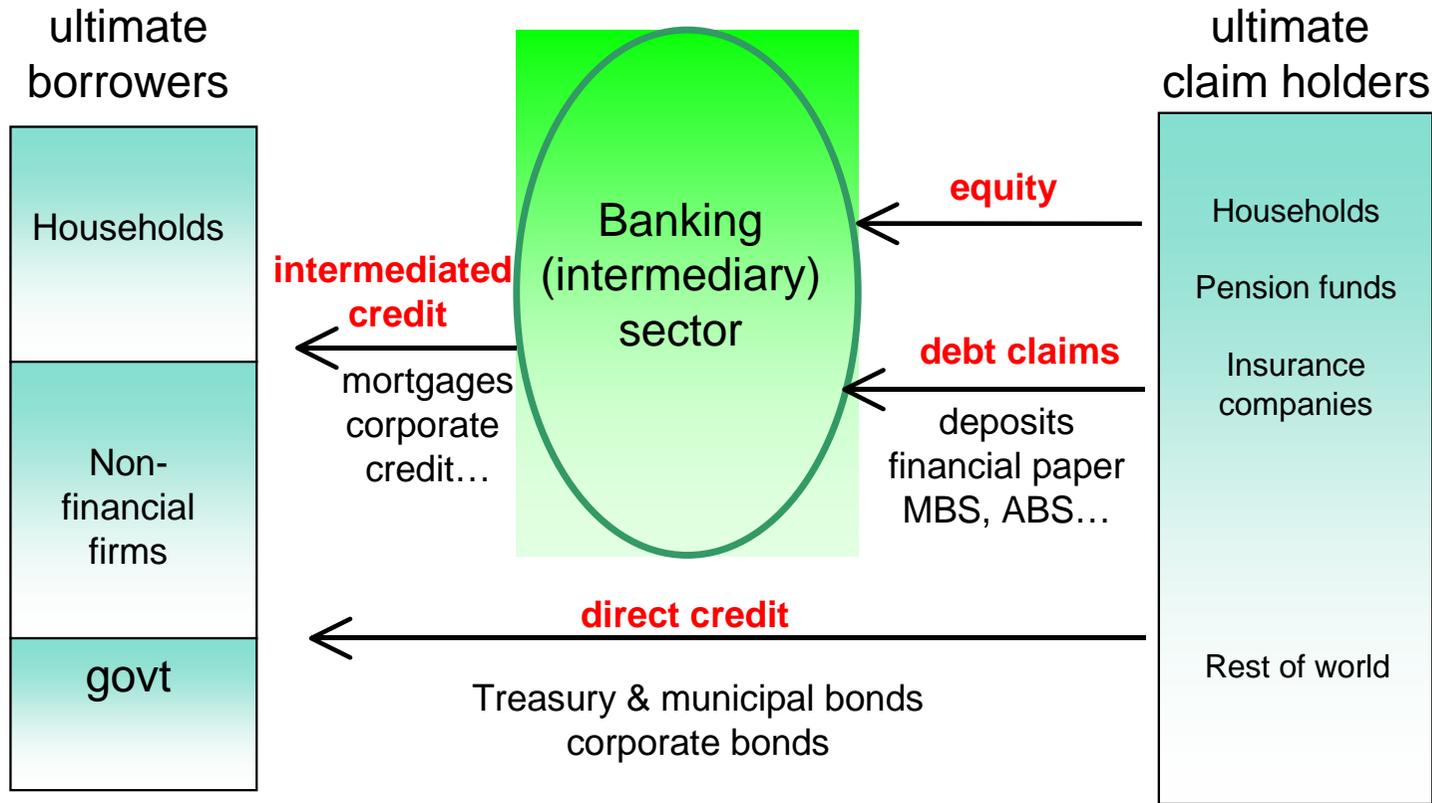

Figure 16. Stylized Financial System for Credit

Assets	Liabilities
Loans to firms, households	Liabilities to non-banks (e.g. deposits)
Claims on other banks	Liabilities to other banks
	Equity

Individual bank

An Accounting Identity

Aggregate lending and aggregate funding satisfy:

$$\sum_{i=1}^n y_i = \sum_{i=1}^n e_i z_i (\lambda_i - 1) + \sum_{i=1}^n e_i$$

where

z_i is proportion of bank i 's liabilities held by non-banks

λ_i is leverage of bank i

e_i is equity of bank i

An Accounting Identity

When leverage λ_i increases, but outside funding remains “sticky” the consequences are twofold:

- Non-core to core funding ratio increases for individual banks (z_i declines)
- Complexity of the system increases (z_i declines)

Short and Long Intermediation Chains

Punchline (Again)

“If you take care of the aggregates, the complexity will take care of itself”

Implications for Early Warning Indicators

- Quantities matter
 - Credit
 - Bank liabilities
 - Monetary aggregates
- Ratio of non-core to core liabilities most informative
 - But what counts as non-core depends on financial system and context
- Double-counting adds to usefulness of the non-core measure
 - Double-counting matters when complexity increases
 - Double-counting enhances signal/noise ratio
